

ABSTRACT OF THE DISCLOSURE

The present invention discloses a method of fabricating a liquid crystal display panel including forming a plurality of first substrates having at least two different sizes and a plurality of second substrates having at least two different sizes on first and second mother substrates, respectively, forming sealant patterns on at least one of the mother substrates, attaching the first and second mother substrates to each other, forming first and second cutting lines on each of the first and second mother substrates, wherein the first cutting line for separating a first unit liquid crystal display panel, which is larger than a second unit liquid crystal display panel separated by the second cutting line, and the first cutting line is extended to the sealant pattern, separating a plurality of the first and second unit liquid crystal display panels from the attached mother substrates, and injecting a liquid crystal into the separated first and second unit liquid crystal panels.
